

# EVOLUTIONARY TALES OF AN API

---

OUR 8 YEAR JOURNEY CULMINATING WITH THE ROLLOUT OF [API.NFL.COM](https://api.nfl.com)

## COMPENDIUM

- ▶ Introduction
- ▶ Early Civilization
- ▶ Middle Ages
- ▶ Age of Aquarius
- ▶ Tomorrowland
- ▶ Wrap Up

# ARASH SHOKOUFANDEH

- ▶ 10 years experience
- ▶ Valkyrie team lead

# EARL NOLAN

- ▶ 30 years experience
- ▶ Meta team lead

## COMPENDIUM

- ▶ Introduction
- ▶ **Early Civilization**
- ▶ Middle Ages
- ▶ Age of Aquarius
- ▶ Tomorrowland
- ▶ Wrap Up

## THE ORIGINAL FEED-FACTORY

- ▶ Started in 2007 and deployed to production in 2007
- ▶ Spring 2.5.6, Hibernate 3.6 and Oracle
- ▶ Responses were hand built to XML using `org.dom4j.Document`
- ▶ Security: one open endpoint to get a cookie

## ENDPOINT MAPPINGS

/articles	/combineProspects	/draftProspectsTest	/injuries	/photoGalleries	/standings

## ISSUES WITH THE ORIGINAL

- ▶ XML only in world where JSON was starting to become popular
- ▶ Hand coding XML led to inconsistencies
  - ▶ Player object different between roster and depth chart
  - ▶ Game object different between schedules and stats

# FEED FACTORY RESTFUL SERVICES

- ▶ Started in 2012 and deployed to production in 2013
- ▶ Spring 3, Hibernate and Oracle
  - ▶ Same data model/site.jar
- ▶ Substantially written in groovy
- ▶ Domain objects translated using Jackson into
  - ▶ XML
  - ▶ JSON
  - ▶ JSONP
- ▶ Security: none, wide open

# ENDPOINT MAPPINGS

## SCORES ENDPOINT

- ▶ `/scores` - Scores of all games in current week
- ▶ `/scores/<season>/<seasonType>/<week>` - Scores of all games in the given week
- ▶ `/scores/byGame/<gameId>` - Score of a single game
- ▶ `/scores/byTeam/<teamAbbr>/<season>` - Scores for a given team and season

# SCHEDULES ENDPOINT

- ▶ `/schedules` - All games schedules for the current season
- ▶ `/schedules/<season>` - All game schedules for the given season
- ▶ `/schedules/byTeam/<teamId or teamAbbr>` - All game schedules for the given team and current season
- ▶ `/schedules/byTeam/<teamId or teamAbbr>/<seasonId>` - All game schedules for the given team and season
- ▶ `/schedules/club/byTeam/<teamId or teamAbbr>` - All **club** game schedules for the given team and current season
- ▶ `/schedules/club/byTeam/<teamId or teamAbbr>/<seasonId>` - All **club** game schedules for the given team and season
- ▶ `/schedules/club/available/<teamAbbr>` - List of seasons for the given team
- ▶ `/schedules/club/byTeam/details/<teamId or teamAbbr>` - All game schedule details for the given team and current season
- ▶ `/schedules/club/byTeam/details/<teamId or teamAbbr>/<seasonId>` - All game schedule details for the given team and season
- ▶ `/schedules/club/byGame/details/<gameId>` - All game schedule details for the give game

## COMMON DATA SERVICES

- ▶ CDS started in Fall 2012, FFRS became a major component
- ▶ Goals
  - ▶ Unify NDC and Club Sites (silo elimination)
  - ▶ Move from Oracle to NOSQL
  - ▶ Tracking access/authentication
  - ▶ Single Source of Truth

# CDS RESULTS

- ▶ Unification: Club sites pulls statistical and schedule data from FFRS. NDC still accesses Oracle directly.
- ▶ Oracle to NOSQL: Added Mongo in addition to Oracle
  - ▶ Supports adding additional fields
- ▶ Tracking access/authentication: Punted
- ▶ Single Source of Truth: Improved
  - ▶ Success: Elias, GSIS, depth chart
  - ▶ Needs work: schedule, injury report

## COMPENDIUM

- ▶ Introduction
- ▶ Early Civilization
- ▶ **Middle Ages**
- ▶ Age of Aquarius
- ▶ Tomorrowland
- ▶ Wrap Up

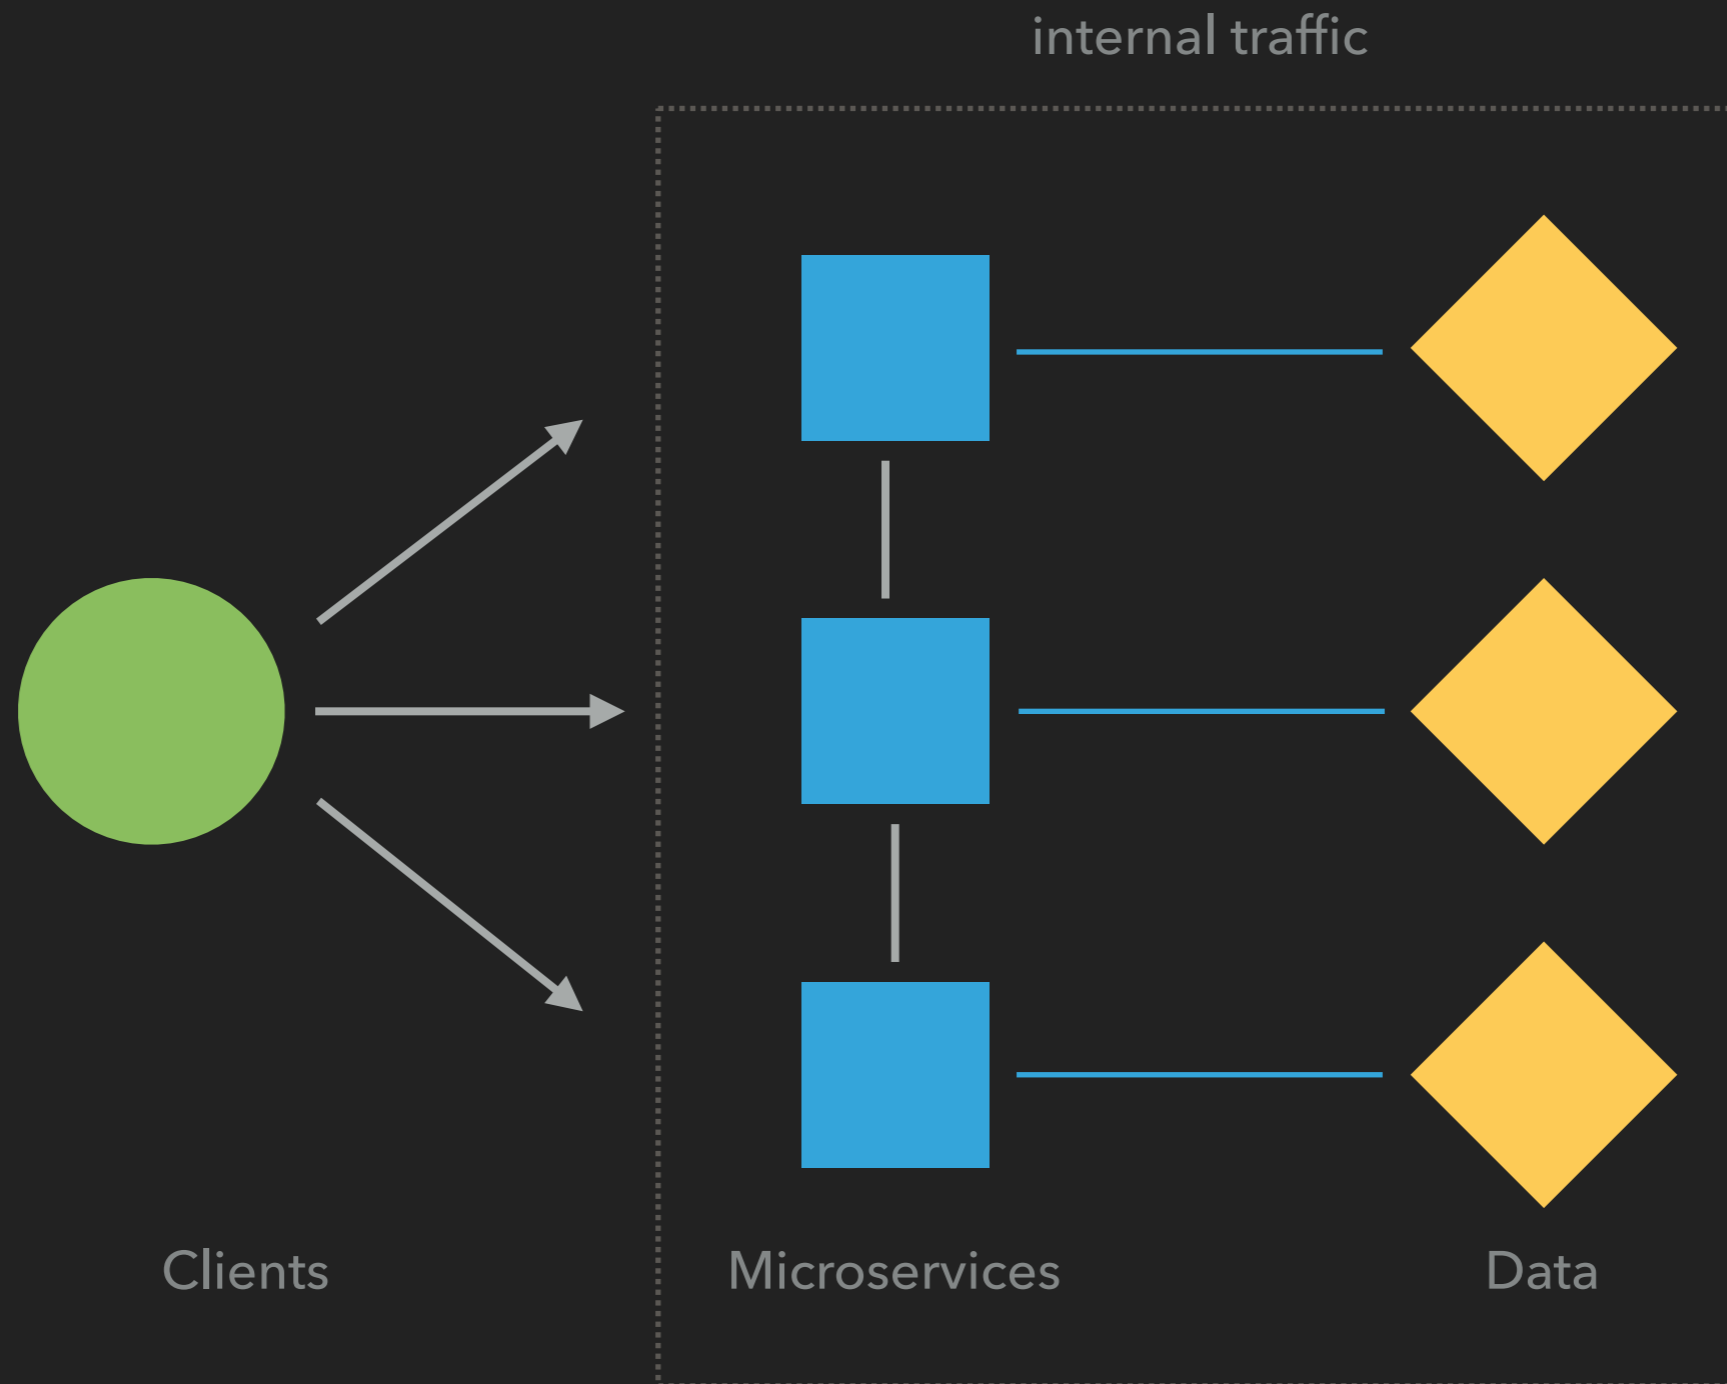

## SHIELD

- ▶ Initially was a read only API
- ▶ Client can retrieve everything in one call
- ▶ Security: JWT via OAuth 2.0
- ▶ API domain modeling
  - ▶ Person/Prospect/Player/Coach
  - ▶ Versions/Timelines

## SHIELD-PROXY

- ▶ A wrapper around FFRS (so still driven by Oracle)
- ▶ Proprietary API language developed in house
- ▶ Built to service a finite set of use cases due to aggressive deadlines (only ever meant to buy time)

# 10,000 FOOT VIEW

# BENEFITS

### ▶ REST

- ▶ Well tested and understood space
- ▶ Ubiquitous across the web

### ▶ Microservices

- ▶ Mostly disparate self-contained apps
  - ▶ Able to be scaled, deployed and developed independently
- ▶ Easy for new devs to pick up and reason about
- ▶ Choose the right tool for the job
- ▶ Allowed us to move to Continuous Delivery

# LIMITATIONS

- ▶ API logic lives on the client
  - ▶ Means that updates are coupled to client updates
  - ▶ Limits ability to change endpoint logic
    - ▶ Ex. GET user in User-Manager
- ▶ Requires multiple roundtrips to build client experiences
  - ▶ At odds with traffic shift to mobile
- ▶ Inter-service communication a major (ongoing) challenge
  - ▶ Resiliency and data consistency have room for improvement

## LESSON LEARNED

- ▶ Be very careful with what you release, short-term solutions turn into long-term headaches
- ▶ Example: shield-proxy
  - ▶ Solution meant to last months has endured years

## OK, THAT WAS A LIE

- ▶ All the APIs we've discussed are all still alive today
- ▶ These systems are still allocated and the APIs still in use
- ▶ Tough to evolve anchored by these legacy platforms
  
- ▶ :(

## COMPENDIUM

- ▶ Introduction
- ▶ Early Civilization
- ▶ Middle Ages
- ▶ Age of Aquarius
- ▶ Tomorrowland
- ▶ Wrap Up

## COMMON REQUESTS FOR A REST API

- ▶ Can I do it in a single call?
  - ▶ Answer: no, that's not how a good restful API works
- ▶ Can you just give me a new endpoint for this?
  - ▶ Answer: we don't want to bloat our system with feature endpoints, sorry.
- ▶ What's the endpoint url?
  - ▶ Answer: often need to message the endpoint...repeatedly

# EVEN TO THIS DAY (MESSAGE FROM MONDAY 9/11/2017)

---

**Arash Shokoufandeh** 11:38 AM

did you add the annotation to the tests too?

11:39 AM

no

**Arash Shokoufandeh** 11:40 AM

ok, we probably need to update our spring tests in these older projects  
the latest spring tests work differently

11:41 AM

this is the diff

<https://phabricator.dm.nfl.com/D31275>

wait sorry

this is it <https://phabricator.dm.nfl.com/D31335>

the first one is the one passing

---

Today

11:05 AM

Hey Arash

do you have that URL for getting an auth token?  
or the curl command

Message 

## LESSON LEARNED

- ▶ Understand your clients and how they'll use your API
- ▶ Example: async persistence
  - ▶ Simple design decision lead to 10x increase in reads
  - ▶ Why? Clients would not move on until they received a successful response

### WHERE WE'RE GOING

- ▶ High Availability (multi-CDN, multi-datacenter)
- ▶ Improved scalability
- ▶ Improved backend velocity
- ▶ Deprecation of legacy systems

## HOW DO WE GET THERE?

- ▶ From the ground up
  - ▶ Started with a new datastore
- ▶ We originally intended to use Neo4J but had scaling problems
- ▶ Decided to hold a competition
  - ▶ Ran two datasources simultaneously to see which was better

## CASSANDRA / GRAPHQL

- ▶ Cassandra as the DB
  - ▶ Distributed/Scales horizontally
  - ▶ Lightning quick with id lookups (our main use case)
- ▶ GraphQL as the API language
  - ▶ Type systems offers a strong client contract
  - ▶ Datafetchers great with microservices
  - ▶ Domain fit intuitively

## LESSON LEARNED

- ▶ Missteps happen, don't be afraid to make mistakes but always be willing to change course
- ▶ Example: Neo4J
  - ▶ Even though we didn't adopt it, the effort taught us that a graph was a very effective way for us to model our data - providing both logical consistency and intuitive reasoning when thinking/discussing our datasets

## ENDPOINT MAPPINGS

- ▶ /v3/shield

## SAMPLE QUERY

```
{  
  user(username:"test") {  
    firstName  
    lastName  
  }  
}
```

## SAMPLE RESPONSE

```
{
  "data": {
    "user": {
      "firstName": "John",
      "lastName": "Doe"
    }
  }
}
```

# GRAPHQL PERSISTENCE

- ▶ Mutators can be individualized to need
- ▶ Mutations are effectively a write followed by a read allowing valuable flexibility by divorcing the two operations
- ▶ Mutations also leverage field selection
- ▶ One major limitation is mutations currently reside under a flat namespace

## SAMPLE MUTATION

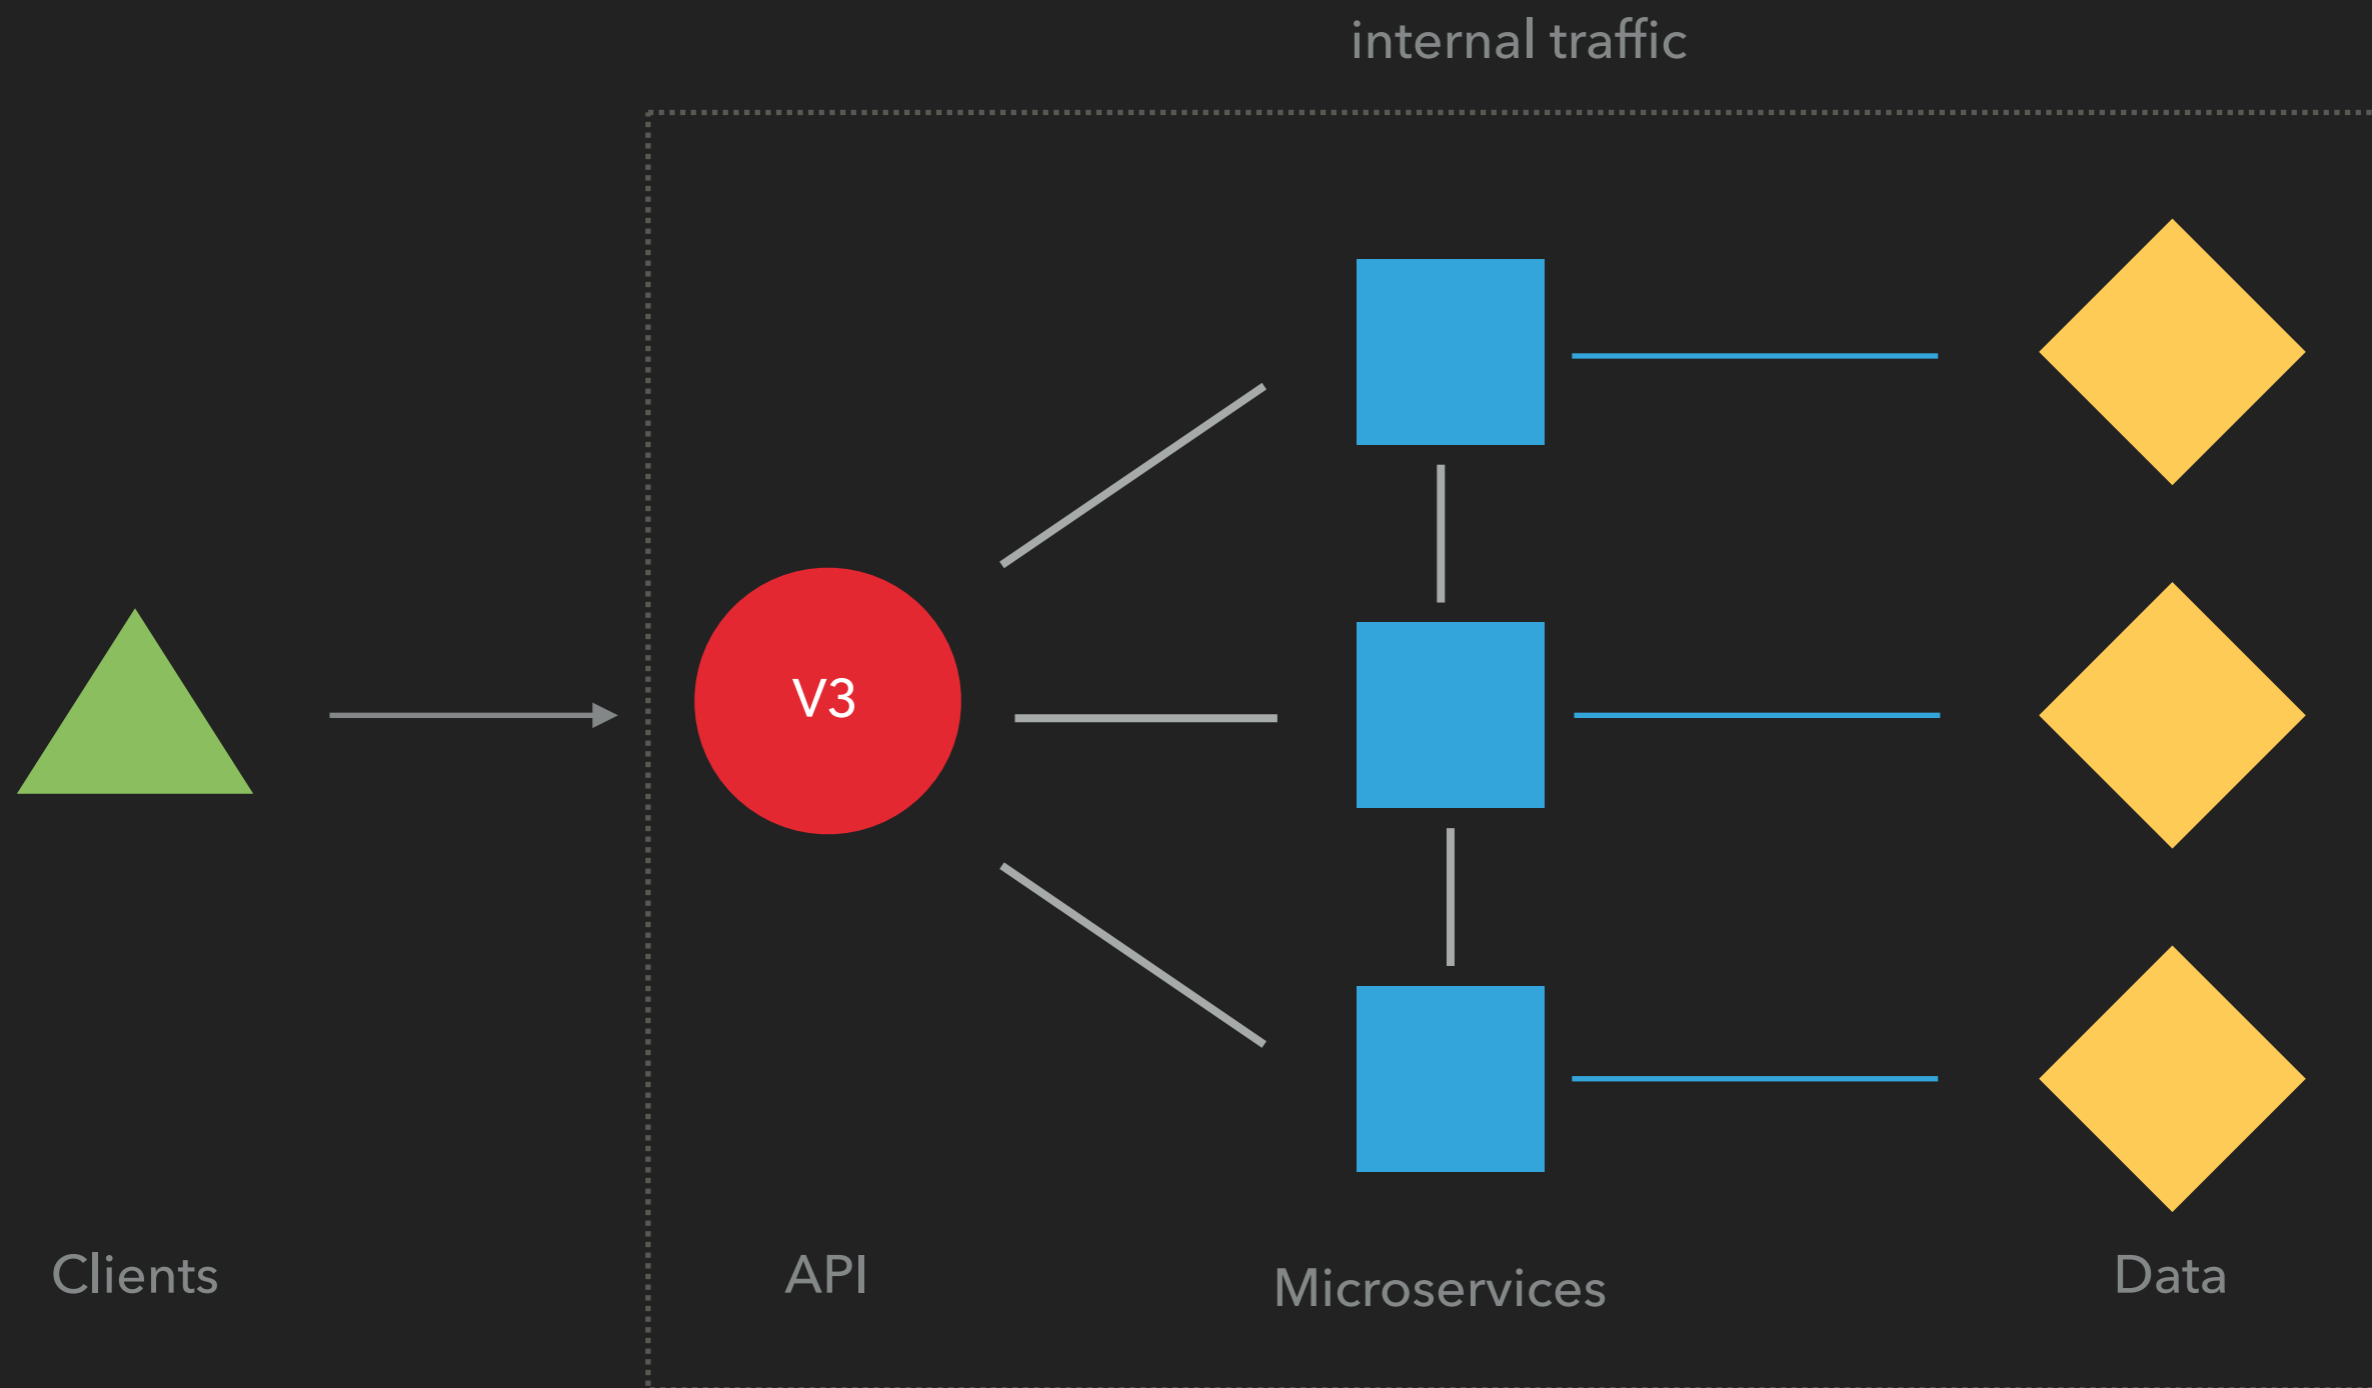

```
mutation {  
  createUser(input:{  
    username:"test"  
    firstName:"John"  
    lastName:"Doe"  
  }) {  
    firstName  
    lastName  
  }  
}
```

EXAMPLE

---

**GRAPHIQL**

# 10,000 FOOT VIEW

### BENEFITS

- ▶ Trading external traffic for internal
- ▶ No API information on client mean easier updates
- ▶ Underlying microservices can use whatever technology best fits need

### CHALLENGES

- ▶ How will giving clients query capabilities affect how we cache
- ▶ How do we prevent the API layer from becoming a kitchen sink?

## LESSON LEARNED

- ▶ Give yourself outs. If an approach doesn't work as well as expected, have a fallback.
- ▶ Example: shield v3
  - ▶ Current: can fallback onto the Restful Microservices
  - ▶ Future: can replace the underlying services

## COMPENDIUM

- ▶ Introduction
- ▶ Early Civilization
- ▶ Middle Ages
- ▶ Age of Aquarius
- ▶ Tomorrowland
- ▶ Wrap Up

## WHAT LIES AHEAD

- ▶ Legacy deprecation (actually powering down servers!!)
- ▶ Achieving HA (multi-CDN, multi-datacenter)
- ▶ Resiliency
  - ▶ What happens when services are unavailable?
- ▶ Fault Tolerance
  - ▶ What happens when things start to misbehave?

## COMPENDIUM

- ▶ Introduction
- ▶ Early Civilization
- ▶ Middle Ages
- ▶ Age of Aquarius
- ▶ Tomorrowland
- ▶ **Wrap Up**

## FINAL TAKEAWAYS

- ▶ API design is hard - likely not to get it right on the 1st, 2nd or even 3rd try
- ▶ Turning off legacy applications is even harder
- ▶ GraphQL is a great integration engine for client applications
- ▶ REST is still powerful and useful
  - ▶ Still building internal services with REST today

## NFL OPEN SOURCE

- ▶ **GLiTR**: POJOs to GraphQL schema made easy
- ▶ **GOLD**: Dynamic Domain driven by GraphQL (now with a starter!)
- ▶ **GraphQL Mediator**: Convert introspection query into usable objects
- ▶ **Audible**: POJO Mapper using Java 8 Lambda and Orika
  
- ▶ For all our open source projects, see:
  - ▶ <https://github.com/NFL>

## QUESTIONS?
